Self-Service Auto Salvage Yard Web Map Application Executive Summary

By Travis Kroger
American River College

Project purpose: This web application will allow users to search, view and share user-submitted content related to self-service auto salvage yards. Information can include locations, layout and organization of the yard, and locations of specific cars (including notes and pictures).

Web Application Content: This application was created using ArcMap and Flexbuilder, and includes the following features:

- ○ User editable location bookmarks
- ○ User editable point (with file attachments allowed), line and polygon features
- ○ Search tools to search content by most recently added, location, and distance from zip code with search results displayed in a table
- ○ Default aerial imagery basemap, with others available for selection by the user

Future Improvements: Future improvements could include giving individual users different editing permissions, customizing the user interface for some of the Flexbuilder tools to make them more intuitive and user-friendly, and standardizing data fields (such as car make and model) to improve search accuracy.
