

## GEOG 93 Final Project

### Project Summary

For my project I used CALFIRE GIS Data of fire perimeters and incorporated area boundaries to identify where wildfires entered incorporated areas through recorded CA wildfire history. Using this data I was able to quantify acres per year which has burned in incorporated areas and analyze common causes of fire ignition. Additionally, I was able to identify regions with recurring wildfire entering WUI communities and built two maps demonstrating overlapping fire perimeters in Santa Rosa, CA and Paradise, CA.
