Summary of Final Project

The goal of my project was to create a working ArcGis Online web application that would show you the closest part of the Folsom bike trails to you. I found this was needed when I moved to Folsom as Google did not know the trails at all which makes it very difficult to navigate even while using the city's downloadable maps. This project consisted of creating a user freindly map of the trails in arcgis, then uploading that map and layout to ArcGis Online and creating a web application. Although many difficulties were found along the way the end product is a working web application that will give you directions to the closest part of the Folsom bike trails to you.
